How to Put Your Claude Website Online for Free: The VibeHost Setup, Step by Step

Get the website Claude built for you off your computer and onto a real web address anyone can open, free. Publish it with one sentence to Claude, or upload it yourself on any Claude plan, then decide who gets to see it.

VibeHost is a deployment platform that turns code generated by AI tools into a live, shareable URL in about five seconds. It supports deploying directly from Claude Code, Cursor and similar agents over MCP or CLI, and from browser canvases via a Chrome extension.

Put simply, VibeHost is a free place to put websites and apps you build with AI, and it isn't tied to any one tool. You can publish from inside Claude, ChatGPT, or Gemini after a one-time connection. You can publish from coding tools like Claude Code, Cursor, and Codex. You can click a button that VibeHost's Chrome add-on puts inside the tool. Or you can upload the website file yourself.

Claude can build you a real website in an afternoon. Then it sits on your computer, where nobody else can see it. By the end of this guide, your website is on the internet at its own address, and it didn't cost you anything. You can text that address to a customer, put it in your Instagram bio, or print it on a business card, and it opens for anyone, on any phone or computer.

GOOD TO KNOW

VibeHost sponsored the video this guide goes with, and the VibeHost links on this page are my partner links. Publishing a website on VibeHost's free plan costs nothing. I show the steps in Claude because that's the tool I build in, but VibeHost isn't tied to Claude. It works the same way with ChatGPT, Gemini, and the coding tools people build with, and Part 9 lists every one of them.

WHAT YOU NEED

A website that Claude built for you, and a free VibeHost account. Start your free VibeHost account here. That's everything for the upload method in Part 3.

The method from the video, in Part 4, is where Claude does the publishing for you. For that one you also need a paid Claude plan. Claude talks to VibeHost through a connector, and connectors are a feature of the paid Claude plans. On a free Claude plan, use the upload method. VibeHost is free either way.

PART 1 Why Your Website Works on Your Computer but Nobody Else Can Open It

When Claude builds a website, what you have is a file saved on your computer, or a preview inside Claude. If you open it in your browser, the address at the top may start with the word “localhost.” That just means it’s on the computer you’re working on right now. It’s a private address, and it only works on that computer. Your site looks finished, but it’s only visible to you.

The internet can’t reach into your computer, and your computer isn’t on and connected every minute of the day. So no customer can open your site, and nobody can share it.

For a website to be live, it has to live on a computer that’s always on and always connected to the internet, with an address people can type. That computer is called a host. VibeHost is a host built for websites and apps made with AI tools, and its free plan

covers up to 100 live websites.

Once your site is published, it has an address that looks like this: **your-site-name-yourname.vibehost.space**

The first part is the name you give the site. The second part is your workspace name, which you pick once when you sign up. Choose a workspace name you're happy to see in every address, like your first name or your business name.

PART 2 How Do You Set Up VibeHost?

You do this once. It takes about two minutes, and there's nothing to download.

1. **Open VibeHost.** Click here to open VibeHost and click **Start free** at the top right.
2. **Sign in with Google.** Pick the Google account you want tied to your websites. You'll use this same account every time you sign in to VibeHost, and later when you connect it to Claude.
3. **Name your workspace.** VibeHost asks you to name your workspace. A workspace is your own space inside VibeHost that holds every site you publish. Its name becomes the second part of every address you'll ever share, so pick something you're happy to see for years. Your first name or your business name both work. Type it, then continue.
4. **You land on your dashboard.** This is your home page inside VibeHost. Every site you publish will show up here, with its address and whether it's public or private. Keep this page handy. You'll come back to it to make a site public, private, or password protected.

That's the whole setup on the VibeHost side. Now pick how you'll publish: upload the file yourself (Part 3), or connect VibeHost to Claude and publish with one sentence, which is what I do in the video (Part 4).

PART 3 The Upload Method: Hand VibeHost Your Website File Yourself

This method works on every Claude plan, including the free one, and there's nothing to connect. Claude keeps your website as a single file, and you hand that file to VibeHost.

1. **Find the download button in Claude.** Open the chat where Claude built your website. The website shows in a panel on the right side of the screen, next to the chat. At the top of that panel there's a download button. Click it.
2. **The file lands in your Downloads folder.** It's one file with a name that ends in .html. That one file is your entire website.
3. **Open your VibeHost dashboard.** Go to app.vibehost.com in your browser and sign in with the same Google account you used in Part 2.
4. **Drop the file onto the upload box.** Your dashboard has a box for uploading a site. Drag the .html file from your Downloads folder and drop it on that box. (If your website is more than one file, like a folder with photos in it, drop the whole folder or a zip. VibeHost takes all three.)
5. **Your address appears.** A few seconds later the site is published and your new address shows on the dashboard. Copy it.
6. **Make it public.** A site you upload this way starts out private, so only you can open it. Part 5 shows the one switch that opens it to everyone.

PART 4 The Method from the Video: Connect VibeHost to Claude Once, Then Publish with One Sentence

This is how I published my website in the video. You connect VibeHost to Claude once, and you never have to do it again. From then on, getting a website online is one sentence to Claude, and about six seconds later Claude hands you the live address.

The one-time connection. VibeHost calls this its MCP server. Claude calls it a connector. They're the same thing: a link that lets Claude talk to VibeHost. Adding one needs a paid Claude plan. On a Team or Enterprise plan, your account owner adds VibeHost once for everyone, and you skip to step 5.

1. **Open the Claude app on your computer** and sign in.
2. **Click your profile icon,** then **Customize**, then **Connectors**. A list of connectors opens. It may already show a few, like GitHub.
3. **Click the + button** at the top right of that list, then **Add custom connector**.
4. **Fill in the two boxes.** Name: **VibeHost**. Remote MCP server URL: `https://api.vibehost.com/mcp`. Leave everything else alone and click **Add**.
5. **Click Connect.** VibeHost now shows in your list with a Custom badge. Click **Connect** next to it. Your browser opens a VibeHost sign-in. Sign in with the same Google account you used for VibeHost, and you're back in Claude.

That's it. VibeHost stays in your connector list, connected, and you never do this again.

Now publish. Go to the chat where Claude built your website, or start a new chat and attach your website file. Then say the sentence:

```
PROMPT

Hey Claude, use VibeHost and publish my website and make it public.
```

Claude creates the site in your VibeHost workspace, sends the website over, and hands you back the live address. When I did this on camera, it took about six seconds.

Say it in those words, because each part does a job. "Publish my website" sends the site to VibeHost. "Make it public" opens it to everyone with the address, so it's live the moment the address comes back. Leave those three words off and the site publishes private, for your eyes only, until you open it. VibeHost won't make a site public unless you ask for it, which means nothing goes live by accident.

IF YOUR WEBSITE LIVES IN A FOLDER ON YOUR COMPUTER

Some people build with Claude Code, the version of Claude that works inside a folder on your computer. It uses the same VibeHost connection. The connection is one line, typed into Claude Code once: `claude mcp add vibehost https://api.vibehost.com/mcp --transport http`. After that, open Claude Code inside your website's folder and say the same sentence from the video. Keep the website in its own folder, because VibeHost publishes everything in the folder you point it at.

PART 5 Who Can See Your Website, and How You Change It

Publishing and being public are two separate switches, and this part is the second one. There are two starting points, and it helps to know which one you're on.

If you said "make it public," like in the video, the site is already open to everyone. You're live. Nothing more to do.

If you uploaded the file yourself, or left "make it public" off, the site starts private. Only you can open it, and the address shows nothing to anyone else. To open it up: go to your VibeHost dashboard, click the site, find its visibility setting, and choose **Public**. Or, if VibeHost is connected to Claude, say: "Make my website public."

Your four choices

Public
Anyone with the address can open it, with no sign-in. This is what "make it public" does, and it's the setting for a site that's open for business.

Private
Only you can open it. Good while you're still working on the site.

A share link
A link you can hand to one person, set to expire when you choose. Good for showing a draft before it's public.

A password
Only people with the password get in. This one is part of the Business plan.

You can switch between these anytime, from your VibeHost dashboard or by asking Claude. “Make my website private again” means nobody else can open it, and nothing is deleted.

PART 6 What's Free, and What Does Business Add?

Publishing is free, and the free plan covers more than most people will ever use. Here are VibeHost’s own numbers.

	Free	Business
Live websites	100	Unlimited
Storage	5 GB	500 GB
Traffic each month	10 GB	1 TB
People on your account	3	Unlimited
Your own domain name	No	Up to 20
Password protection	No	Yes
Shows up in Google search	No. Addresses ending in vibehost.space are kept out of search results.	Yes, on your own domain name
Price	$0	$20 a month for the entire workspace, not per person. Paid yearly, it's $199 a year, about $17 a month.

IF YOU WANT YOUR OWN DOMAIN NAME OR A PASSWORD

Start on free. When you want your own domain name, like yourbusiness.com, or a password on a site, starting Business through my link gets you your first month free. After that it's $20 a month. The full details are on VibeHost's pricing page.

PART 7 Troubleshooting: If Something Doesn't Look Right, Here's the Fix

Here are the five things most likely to trip you up, and the fix for each one.

What you're seeing, and the fix
"Workspace not found" You have an account but no workspace yet. Open VibeHost, finish the setup, and name one.
The address works for you and nobody else The site is still private. Make it public from your dashboard, or tell Claude "Make my website public."
Claude says there's no workspace selected, or that you need a team Tell Claude: "Select my VibeHost workspace, create a team if I need one, and publish again."
You published a change and still see the old version Give it a minute and refresh. VibeHost says the address can show the earlier version for up to about a minute after you publish again.
Files you didn't mean to share are online They were in the folder you published. Move the website into its own folder and publish again.

PART 8 You're in Charge of When It's Live

Check that it’s really live. Open the address on your computer, and then on your phone. If it opens on both, it’s live, and that’s exactly how a customer will see it on either screen.

Read the page once before it’s public. Look for anything personal you’d rather keep private. A home address, for example, or a phone number.

Changing it later. If VibeHost is connected to Claude, ask Claude for the edit and say “publish my website” again. If you uploaded the file yourself, download the new version from Claude and upload it to the same site on your VibeHost dashboard. Either way, the same address shows the new version, so nobody has to learn a new link.

Taking it down. Tell Claude “Make my website private again,” or open the site on your VibeHost dashboard and switch it to Private. Nobody else can open it, and nothing is deleted.

PART 9 Not Building in Claude? VibeHost Works With These Too

You don’t have to build in Claude to use VibeHost. It publishes from a lot of different AI tools, so you can build your site in whichever one is your favorite. Here’s everything it works with, and here’s the setup for each one.

Every way in
Chat tools, connected once like in Part 4 Claude, ChatGPT, and Gemini Spark. ChatGPT connects through its Apps settings and also needs a paid ChatGPT plan. After the connection, you ask the tool to publish, the same way as the video.
Coding tools Claude Code, Codex, Cursor, Antigravity, Windsurf, OpenCode, GitHub Copilot, Hermes Agent, and Grok Build. Each one connects to VibeHost and then publishes when you ask it to.
The Chrome add-on Puts a "Deploy to VibeHost" button right inside Gemini Canvas, Google AI Studio, ChatGPT Canvas, and v0. You click the button, pick your workspace, and the address comes back. No connection setup at all. For a website Claude built, use Part 3 or Part 4.
Upload by hand The upload method in Part 3. Drop the website file on your VibeHost dashboard. Works with a site from any tool.

YOUR CHECKLIST

1. Create your free VibeHost account and name your workspace. 2. Pick your method: upload the file (Part 3) or connect Claude and say the sentence (Part 4). 3. Publish, and make it public. 4. Open the address on your computer and your phone to confirm it's live.

FAQ Questions People Ask About Putting a Claude Website Online

Straight answers

What is VibeHost?
VibeHost is a deployment platform that turns code generated by AI tools into a live, shareable URL in about five seconds. It supports deploying directly from Claude Code, Cursor and similar agents over MCP or CLI, and from browser canvases via a Chrome extension.

How do I put a website I made with Claude online?
You publish it with a host, and VibeHost is a host made for websites built with AI tools. Connect VibeHost to Claude once, then tell Claude to publish your website with VibeHost. If you'd rather skip the setup, upload the website file to VibeHost yourself. Either way you get a real web address on the internet in about six seconds.

Why does my website work on my computer but nobody else can open it?
Because it's still a file on your computer, not on the internet. The address you see, which often starts with localhost, only works on the computer you're sitting at. Publishing it with a host like VibeHost gives it a real address that opens anywhere.

Does VibeHost only work with Claude?
No. VibeHost works with whichever AI tool built your site. It connects the same way to ChatGPT and Gemini, it works inside coding tools like Claude Code, Cursor, and Codex, its Chrome add-on puts a publish button inside ChatGPT Canvas and Gemini Canvas, and you can always upload the file by hand. This guide shows Claude because that's what I use.

Is VibeHost free?
Yes, there's a free plan. VibeHost's free plan covers 100 live websites, 5 GB of storage, and 10 GB of traffic a month. Custom domains and password protection are part of the Business plan, which is $20 a month for the entire workspace.

How long does it take to publish a website with VibeHost?
About six seconds. That's how long it took from the moment I said the sentence to Claude until the live address came back, and you can watch it happen in the video.

Is my website public as soon as I publish it?
Only if you ask for that. In the video I say "publish my website and make it public," and the site is open to everyone the moment the address comes back. If you leave those words off, or you upload the file yourself, the site starts private, and you make it public from your VibeHost dashboard or by asking Claude.

Can I use my own domain name or put a password on my website?
Both are part of the Business plan. It includes up to 20 custom domains, and a password means only the people you give it to can open the site. On the free plan your site lives at an address that ends in vibehost.space, open to anyone you make it public for.

SOURCES Where to Go Deeper

Ready to do more with your website? These are VibeHost's help pages, one for each tool and feature. Come back to them when you want your own domain name, a password on a site, or to publish from a different AI tool.
